Applied Machine Learning

Imputation and Feature Selection

Yasin Ceran

Dealing with missing values

- Missing values can be encoded in many ways
- Numpy has no standard format for it (often np.NaN) - pandas does
- Sometimes: 999, ???, ?, np.inf, “N/A”, “Unknown“ ...
- Not discussing “missing output” - that’s semi-supervised learning.
- Often missingness is informative!

```
array([[ nan,  3.2,  5.7,  2.3],
       [ nan,  2.8,  4.9,  2. ],
       [ nan,  2.8,  6.7,  2. ],
       [ nan,  2.7,  4.9,  1.8],
       [ 6.7,  3.3,  5.7,  2.1],
       [ nan,  3.2,  6. ,  1.8],
       [ nan,  2.8,  4.8,  1.8],
       [ nan,  3. ,  4.9,  1.8],
       [ nan,  2.8,  5.6,  2.1],
       [ nan,  3. ,  5.8,  1.6],
       [ 7.4,  2.8,  6.1,  1.9],
       [ nan,  3.8,  6.4,  2. ],
       [ 6.4,  2.8,  5.6,  2.2],
       [ nan,  2.8,  5.1,  1.5],
       [ nan,  2.6,  5.6,  1.4],
       [ nan,  3. ,  6.1,  2.3],
       [ nan,  3.4,  5.6,  2.4],
       [ nan,  3.1,  5.5,  1.8],
       [ nan,  3. ,  4.8,  1.8],
       [ 6.9,  3.1,  5.4,  2.1],
       [ 6.7,  3.1,  5.6,  2.4],

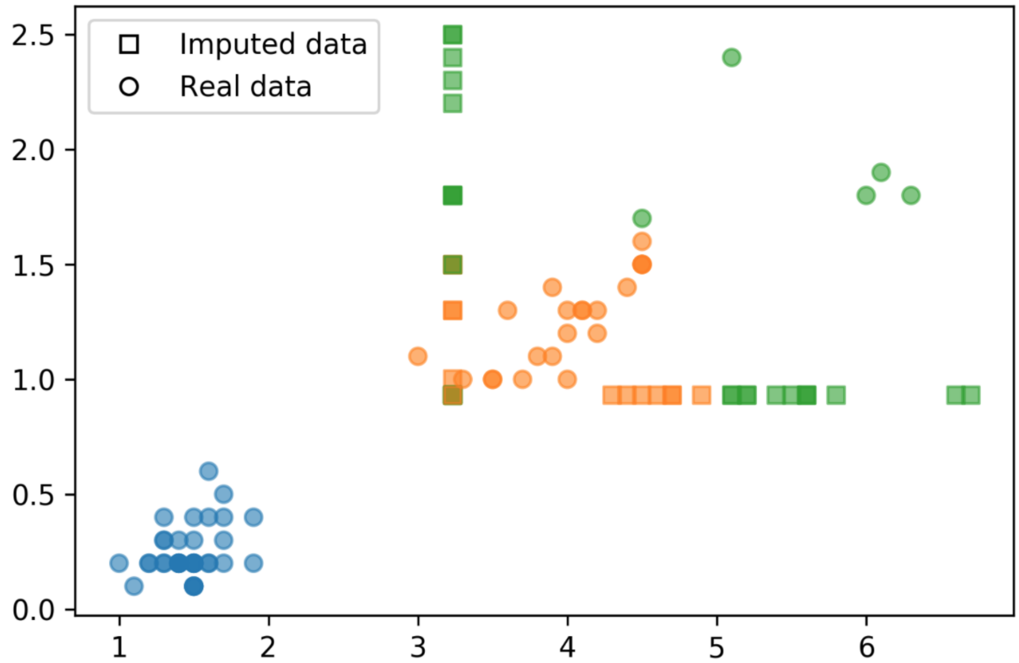
       [ 6.7  ,  3.3  ,  5.7  ,  2.5  ]])
```

Mean imputation



```python
from sklearn.pipeline import make_pipeline
from sklearn.preprocessing import StandardScalar

nan_columns = np.any(np.isnan(X_train), axis = 0)
X_drop_columns = X_train[:,~nan_columns]
logreg = make_pipeline(StandardScalar(), LogisticRegression())
scores = cross_val_score(logreg, X_drop_columns, y_train, cv = 10)
np.mean(scores)
```

0.794

```python
mean_pipe = make_pipeline(Imputer(), StandardScalar(),
                          LogisticRegression())
scores = cross_val_score(mean_pipe, X_train, y_train, cv =10)
np.mean(scores)
```

0.729

KNN Imputation

- Find k nearest neighbors that have non-missing values.
- Fill in all missing values using the average of the neighbors.

KNN Imputation

```python
# Very inefficient didactic implementation

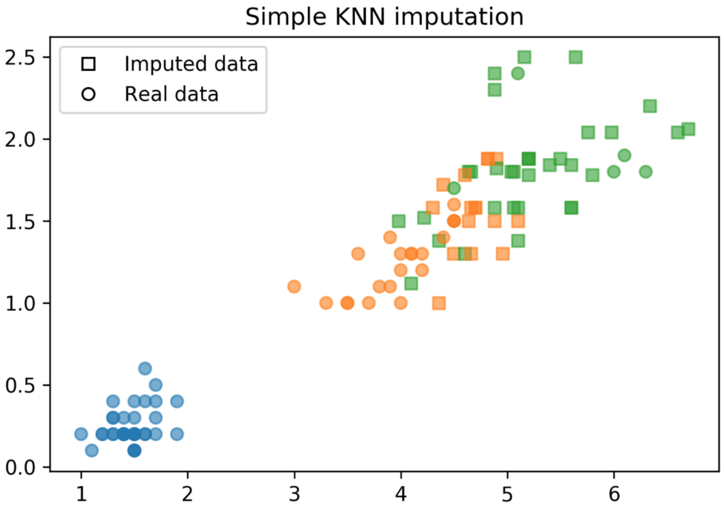
distances = np.zeros((X_train.shape[0], X_train.shape[0]))
for i, x1 in enumerate(X_train):
    for j, x2 in enumerate(X_train):
        dist = (x1 - x2) ** 2
        nan_mask = np.isnan(dist)
        distances[i, j] = dist[~nan_mask].mean() * X_train.shape[1]

neighbors = np.argsort(distances, axis=1)[:, 1:]
n_neighbors = 3

X_train_knn = X_train.copy()
for feature in range(X_train.shape[1]):
    has_missing_value = np.isnan(X_train[:, feature])
    for row in np.where(has_missing_value)[0]:
        neighbor_features = X_train[neighbors[row], feature]
        non_nan_neighbors = neighbor_features[~np.isnan(neighbor_features)]
        X_train_knn[row, feature] = non_nan_neighbors[:n_neighbors].mean()
```

```
scores = cross_val_score(logreg, X_train_knn, y_train, cv=10)
np.mean(scores)
```

```
0.849
```



Model-Driven Imputation

- Train regression model for missing values
- Possibly iterate: retrain after filling in
- Very flexible!

Model-driven Imputation w RF

```python
rf = RandomForestRegressor(n_estimators=100)
X_imputed = X_train.copy()

for i in range(10):
    last = X_imputed.copy()
    for feature in range(X_train.shape[1]):
        inds_not_f = np.arange(X_train.shape[1])
        inds_not_f = inds_not_f[inds_not_f != feature]
        f_missing = np.isnan(X_train[:, feature])
        rf.fit(X_imputed[~f_missing][:, inds_not_f], X_train[~f_missing, feature])

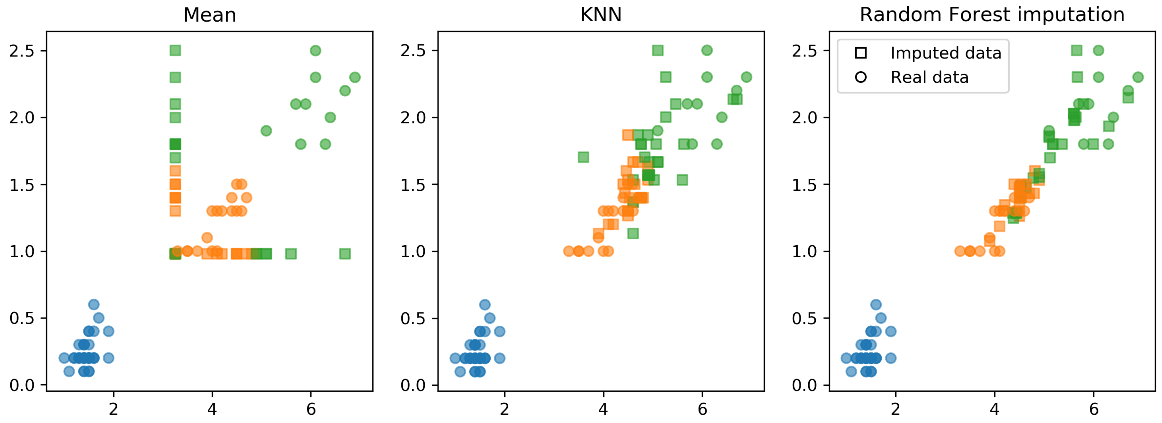
        X_imputed[f_missing, feature] = rf.predict(
            X_imputed[f_missing][:, inds_not_f])

    if (np.linalg.norm(last - X_imputed)) < .5:
        break

scores = cross_val_score(logreg, X_imputed, y_train, cv=10)
np.mean(scores)
```

0.855

Comparision of Imputation Methods



Feature Selection

Why Select Features?

- Faster prediction and training
- Less storage for model and dataset
- More interpretable model

Types of Feature Selection

- Unsupervised vs Supervised
- Univariate vs Multivariate
- Model based or not

Unsupervised Feature Selection

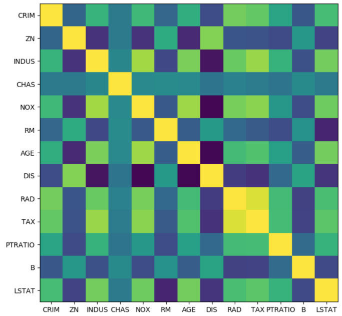
- May discard important information
- Variance-based: 0 variance or few unique values
- Covariance-based: remove correlated features
- PCA: remove linear subspaces

Covariance

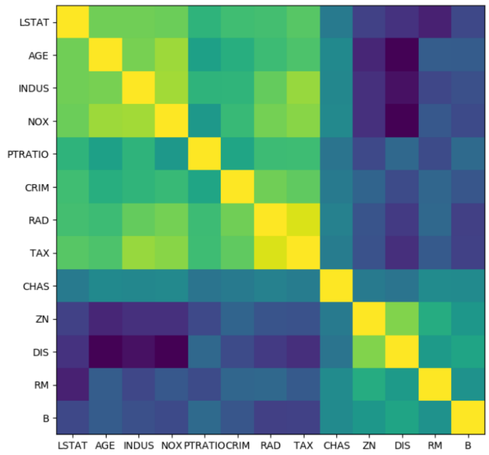
```python
from sklearn.preprocessing import scale

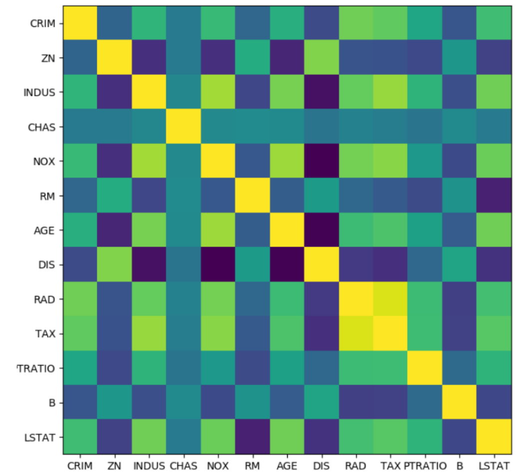
boston = load_boston()
X, y = boston.data, boston.target
X_train, X_test, y_train, y_test = train_test_split(X, y, random_state=0)
X_train_scaled = scale(X_train)

cov = np.cov(X_train_scaled, rowvar=False)
```



```python
from scipy.cluster import hierarchy
order = np.array(hierarchy.dendrogram(
    hierarchy.ward(cov),no_plot=True)['ivl'], dtype="int")
```



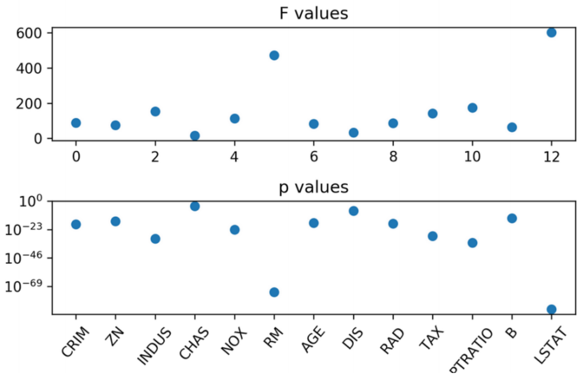


Supervised Feature Selection

Univariate Statistics

- Pick statistic, check p-values !
- f_regression, f_classsif, chi2 in scikit-learn

```python
from sklearn.feature_selection import f_regression
f_values, p_values = f_regression(X, y)
```



```python
from sklearn.feature_selection import SelectKBest, SelectPercentile, SelectFpr
from sklearn.linear_model import RidgeCV

select = SelectKBest(k=2, score_func=f_regression)
select.fit(X_train, y_train)
print(X_train.shape)
print(select.transform(X_train).shape)
```

```
(379, 13)
(379, 2)
```

```python
from sklearn.feature_selection import SelectKBest, SelectPercentile, SelectFpr
from sklearn.linear_model import RidgeCV

select = SelectKBest(k=2, score_func=f_regression)
select.fit(X_train, y_train)
print(X_train.shape)
print(select.transform(X_train).shape)
```

```
(379, 13)
(379, 2)
```

```python
all_features = make_pipeline(StandardScaler(), RidgeCV())
np.mean(cross_val_score(all_features, X_train, y_train, cv=10))
```

0.718

```python
from sklearn.feature_selection import SelectKBest, SelectPercentile, SelectFpr
from sklearn.linear_model import RidgeCV

select = SelectKBest(k=2, score_func=f_regression)
select.fit(X_train, y_train)
print(X_train.shape)
print(select.transform(X_train).shape)
```

```
(379, 13)
(379, 2)
```

```python
all_features = make_pipeline(StandardScaler(), RidgeCV())
np.mean(cross_val_score(all_features, X_train, y_train, cv=10))
```

0.718

```python
select_2 = make_pipeline(StandardScaler(),
                         SelectKBest(k=2, score_func=f_regression), RidgeCV())
np.mean(cross_val_score(select_2, X_train, y_train, cv=10))
```

0.624

Model-Based Feature Selection

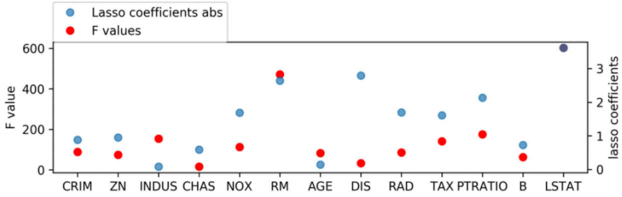
- Get best fit for a particular model
- Ideally: exhaustive search over all possible combinations
- Exhaustive is infeasible (and has multiple testing issues)
- Use heuristics in practice.

Model based (single fit)

- Build a model, select features important to model
- Lasso, other linear models, tree-based Models
- Multivariate - linear models assume linear relation

```
from sklearn.linear_model import LassoCV
X_train_scaled = scale(X_train)
lasso = LassoCV().fit(X_train_scaled, y_train)
print(lasso.coef_)
```

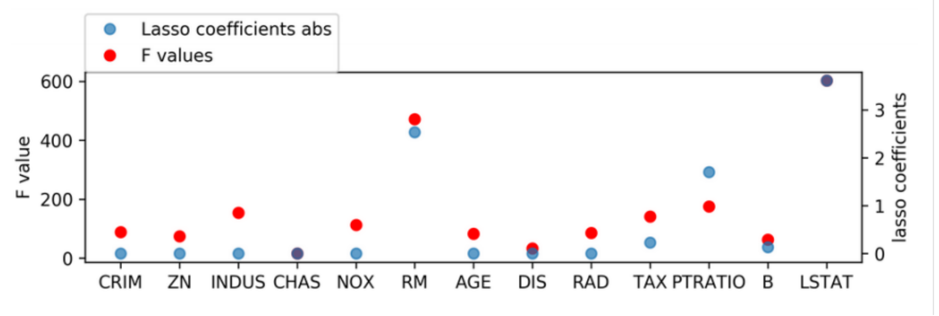
[-0.881 0.951 -0.082 0.59 -1.69 2.639 -0.146 -2.796 1.695 -1.614 -2.133 0.729 -3.615]



Changing Lasso alpha

```
from sklearn.linear_model import Lasso
X_train_scaled = scale(X_train)
lasso = Lasso().fit(X_train_scaled, y_train)
print(lasso.coef_)
```

[-0. 0. -0. 0. -0. 2.529 -0. -0. -0. -0.228 -1.701 0.132 -3.606]



SelectFromModel

```
from sklearn.feature_selection import SelectFromModel
select_lassocv = SelectFromModel(LassoCV(), threshold=1e-5)
select_lassocv.fit(X_train, y_train)
print(select_lassocv.transform(X_train).shape)
```

```
(379,11)
```

SelectFromModel

```
from sklearn.feature_selection import SelectFromModel
select_lassocv = SelectFromModel(LassoCV(), threshold=1e-5)
select_lassocv.fit(X_train, y_train)
print(select_lassocv.transform(X_train).shape)
```

```
(379,11)
```

```
pipe_lassocv = make_pipeline(StandardScaler(), select_lassocv, RidgeCV())
np.mean(cross_val_score(pipe_lassocv, X_train, y_train, cv=10))
np.mean(cross_val_score(all_features, X_train, y_train, cv=10))
```

```
0.717
0.718
```

SelectFromModel

```
from sklearn.feature_selection import SelectFromModel
select_lassocv = SelectFromModel(LassoCV(), threshold=1e-5)
select_lassocv.fit(X_train, y_train)
print(select_lassocv.transform(X_train).shape)
```

```
(379,11)
```

```
pipe_lassocv = make_pipeline(StandardScaler(), select_lassocv, RidgeCV())
np.mean(cross_val_score(pipe_lassocv, X_train, y_train, cv=10))
np.mean(cross_val_score(all_features, X_train, y_train, cv=10))
```

```
0.717
0.718
```

```
# could grid-search alpha in lasso
select_lasso = SelectFromModel(Lasso())
pipe_lasso = make_pipeline(StandardScaler(), select_lasso, RidgeCV())
np.mean(cross_val_score(pipe_lasso, X_train, y_train, cv=10))
```

```
0.671
```

Iterative Model-Based Selection

- Fit model, find least important feature, remove, iterate.
- Or: Start with single feature, find most important feature, add, iterate.

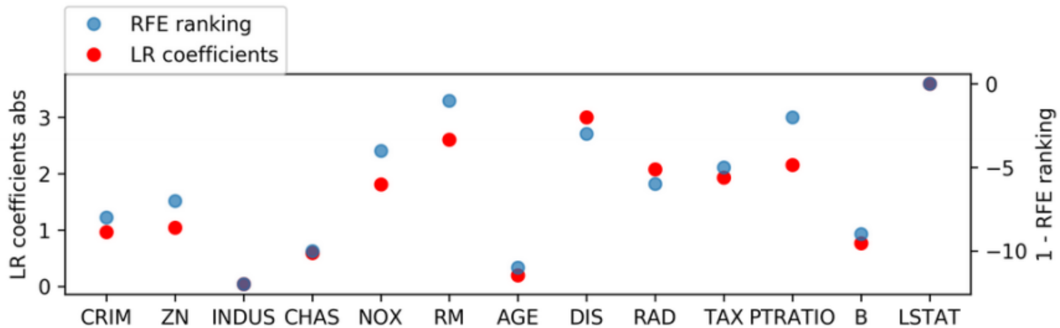
Recursive Feature Elimination

- Uses feature importances / coefficients, similar to “SelectFromModel”
- Iteratively removes features (one by one or in groups)
- Runtime: (n_features - n_feature_to_keep) / stepsize

```python
from sklearn.linear_model import LinearRegression
from sklearn.feature_selection import RFE

# create ranking among all features by selecting only one
rfe = RFE(LinearRegression(), n_features_to_select=1)
rfe.fit(X_train_scaled, y_train)
rfe.ranking_
```

array([9, 8, 13, 11, 5, 2, 12, 4, 7, 6, 3, 10, 1])



RFECV

```python
from sklearn.linear_model import LinearRegression
from sklearn.feature_selection import RFECV
rfe = RFECV(LinearRegression(), cv=10)
rfe.fit(X_train_scaled, y_train)
print(rfe.support_)
print(boston.feature_names[rfe.support_])
```

```
[ True  True False  True  True  True False  True  True  True  True  True
  True]
['CRIM' 'ZN' 'CHAS' 'NOX' 'RM' 'DIS' 'RAD' 'TAX' 'PTRATIO' 'B' 'LSTAT']
```

```python
pipe_rfe_ridgecv = make_pipeline(StandardScaler(),
                                 RFECV(LinearRegression(), cv=10), RidgeCV())
np.mean(cross_val_score(pipe_rfe_ridgecv, X_train, y_train, cv=10))
```

```
0.710
```

```python
pipe_rfe_ridgecv = make_pipeline(StandardScaler(),
                                 RFECV(LinearRegression(), cv=10), RidgeCV())
np.mean(cross_val_score(pipe_rfe_ridgecv, X_train, y_train, cv=10))
```

```
0.710
```

```python
from sklearn.preprocessing import PolynomialFeatures
pipe_rfe_ridgecv = make_pipeline(StandardScaler(), PolynomialFeatures(),
                                 RFECV(LinearRegression(), cv=10), RidgeCV())
np.mean(cross_val_score(pipe_rfe_ridgecv, X_train, y_train, cv=10))
```

```
0.820
```

Wrapper Methods

- Can be applied for ANY model!
- Shrink / grow feature set by greedy search
- Called Forward or Backward selection
- Run CV / train-val split per feature
- Complexity: n_features * (n_features + 1) / 2
- Implemented in mlxtend

SequentialFeatureSelector

```python
from mlxtend.feature_selection import SequentialFeatureSelector
sfs = SequentialFeatureSelector(LinearRegression(), forward=False, k_features=7)
sfs.fit(X_train_scaled, y_train)
```

```
Features: 7/7
```

```python
print(sfs.k_feature_idx_)
print(boston.feature_names[np.array(sfs.k_feature_idx_)])
```

```
(1, 4, 5, 7, 9, 10, 12)
['ZN' 'NOX' 'RM' 'DIS' 'TAX' 'PTRATIO' 'LSTAT']
```

```python
sfs.k_score_
```

```
0.725
```
